The new edition of Crew Resource Management reflects advancements made in the conceptual foundation as well as the methods and approaches of applying CRM in the aviation industry. Because CRM training has the practical goal of enhancing flight safety through more effective flight crew performance, this new edition adapts itself to fit the users, the task, and operational and regulatory environments--all of which continually evolve. Each contributor examines techniques and presents cases that best illustrate CRM concepts and training. This book discusses the history and research foundation of CRM and also stresses the importance of making adaptive changes and advancements. New chapters include: CRM and Individual Resilience; Flight and Cabin Crew Teamwork: Improving Safety in Aviation: CRM and Risk Management/Safety Management Systems; and MRM for Technical Operations. This book provides a deep understanding of CRM--what it is, how it works, and how to practically implement an effective program. Addresses the expanded operating environment--pilots, flight attendants, maintenance, etc. Assists developers and practitioners in building effective programs Describes best practices and tools for supporting CRM training in individual organizations Highlights new advances and approaches to CRM Includes five completely new chapters

Most aviation accidents are attributed to human error, pilot error especially. Human error

also greatly effects productivity and profitability. In his overview of this collection of papers, the editor points out that these facts are often misinterpreted as evidence of deficiency on the part of operators involved in accidents. Human factors research reveals a more accurate and useful perspective: The errors made by skilled human operators - such as pilots, controllers, and mechanics - are not root causes but symptoms of the way industry operates. The papers selected for this volume have strongly influenced modern thinking about why skilled experts make errors and how to make aviation error resilient.

The book addresses all major aspects to be considered for the design and operation of aircrafts within the entire transportation chain. It provides the basic information about the legal environment, which defines the basic requirements for aircraft design and aircraft operation. The interactions between airport, air traffic management and the airlines are described. The market forecast methods and the aircraft development process are explained to understand the very complex and risky business of an aircraft manufacturer. The principles of flight physics as basis for aircraft design are presented and linked to the operational and legal aspects of air transport including all environmental impacts. The book is written for graduate students as well as for engineers and experts, who are working in aerospace industry, at airports or in the domain of transport and logistics.
