4.4 Community Ecology Populations typically do not live in isolation from other species. Populations that interact within a given habitat form a community. The number of species occupying the same habitat and their relative abundance is known as the diversity of the community. Areas with low species diversity, such as the glaciers of Antarctica, still contain a wide variety of living organisms, whereas the diversity of tropical rainforests is so great that it cannot be accurately assessed.

Explanation: . In a mutualistic relationship, both organisms benefit from the relationship. In this example, the human host benefits because (s)he gains access to nutrients and is at a lower risk of hosting dangerous E. coli, while the bacteria species benefits because it gains access to a habitat.. A competitive relationship exists when two species share a predator, are competing for the same ...
