This publication sets out best practice guidance on the design of healthcare facilities for children and adolescents, with the aim of creating a child-centred built environment. It is primarily intended for new-builds and upgrades of existing children's facilities. Central considerations are alleviating fear and anxiety, maximising security and safety, reducing boredom, and creating a healing environment. Facilities should also cater for parents and siblings. Issues discussed include: general functional and design considerations, including patient groups, capacity planning, space, access and security requirements, play facilities and privacy aspects; design of specific service areas, including reception, out-patient and in-patient facilities; engineering services; and cost information.

Provides guidance to help health planners, estates and facilities managers, sterile services managers and capital planning and design teams to plan and design a sterile services department. It discusses the objectives of a sterile services department (SSD) and service requirements, particularly focusing on: raising standards in decontamination services by optimising the built environment: service requirements strategy: calculating the optimum capacity of an SSD to eradicate bottlenecks: determining the most appropriate location of an SSD. Design guidance based on the above service objectives is outlined. Finally, the finer details of the individual spaces within an SSD are discussed.

This publication contains guidance on the planning and design of facilities for rehabilitation services provided within acute general hospitals, as well as in a range of community settings. It adopts a modular approach to the topic, which describes facilities for separate elements of a general rehabilitation service that can be put together as circumstances require and according to local needs, to achieve good management and value for money in capital and revenue terms. Recognition is given to the need to make decisions locally, as close to the patient as possible, and the involvement of service users and representatives in the planning and design process is encouraged. Sections cover: general service considerations; environment and design considerations, operational aspects including health and safety, catering and domestic services, health records service and IT; general planning issues including parking, entrance and reception areas, clinical and therapeutic spaces; engineering considerations; and cost information. It also includes case studies of four different settings and a patient's perspective of using the services of a rehabilitation unit. This publication supersedes the previous edition (ISBN 0113224516) published in 2000.

Supplies guidance relevant to facilities for surgical procedures in all healthcare settings. This volume covers the facilities required to support in-patient operating theatres in an acute general hospital.

This Health Technical Memorandum takes the form of best practice guidance and recommendations. It provides guidance on the design of fire precautions in new healthcare buildings and major extensions to existing healthcare buildings. It supersedes HTM 81 (ISBN 9780113210824), and HTM 85 (ISBN 9780113217335). This publication provides guidance to achieve a satisfactory standard of fire safety, and recognizes the special requirements of fire precautions in the design of healthcare premises and should allow the current statutory regulations to be applied sensibly within a framework of understanding. The guidance in this HTM satisfies all requirements of Part B - Fire Safety of the Building Regulations 2000 (as amended).

This book is a comprehensive guide to the theory and practice of lighting. Covering the physics of light production, light sources, circuits and a wide variety of lighting applications, it is both suitable as a detailed textbook and as thoroughly practical guide for practising lighting engineers. This fourth edition of Lamps and Lighting has been completely updated with new chapters on the latest lamp technology and applications. The editors have called upon a wide range of expertise and as a result many sections have been broadened to include both European and US practice. The book begins with a description of the fundamentals of light, vision, colour and measurement. Part II, the main section of the book, deals with lamps and control equipment and includes descriptions of all lamp types in use today. Part III on lighting covers both interior and exterior applications.

This publication contains guidance to NHS organisations on planning and designing comprehensive mortuary and post-mortem facilities, including accommodation for the receipt, storage, viewing and removal of bodies; post-mortem examinations; visiting relatives and friends; staff support facilities; teaching and research. This third edition of the publication builds on and replaces the second edition published in 2001 (ISBN 0113224605).

Healthcare Engineering - Latest Developments and Applications focuses on building design and management, environmental issues including energy consumption and emission, plus air quality and infection control in patient areas. Providing an insight into the solutions offered by new technologies and systems to building management challenges Healthcare Engineering - Latest Developments and Applications identifies ideas for improved design and layout of hospitals and equipment. As well as practical advice on how to control energy consumption, and updates on the latest research into hospital acquired infection, this volume gives detailed analysis of hygiene control in operating theatres. An up-to-date text essential for the study of Healthcare Engineering.

This well established handbook, written and sponsored by the Electrical Contractors' Association and Select (formerly the Electrical Contractors' Association of Scotland), provides a detailed, authoritative guide to the Wiring Regulations, BS 7671: Requirements for Electrical Installations. As the regulations are not drafted by topic, the handbook will be particularly useful in guiding designers, installers, inspectors and testers round the various requirements. It gives practical guidance on how to approach new installations, extensions to existing installations, and the more extensive testing and inspection which are required. The handbook has been revised to take account of amendments introduced by BS 7671:2001 effective from 1 January 2002. The most significant changes are: · chapter 13 rewritten to include three sections on protection for safety, design and selection of electrical equipment · a new chapter 44 on overvoltage protection · a new chapter 48 on high fire risk situations · revisions to the requirements on rooms containing a bath or shower · new earthing requirements for the installation of equipment with high protective conductor outlets

Written primarily for the practising designer, The Design of Lighting brings together in one volume all that the practitioner is likely to need. The authors combine a technical introduction to lighting and colour theory with a guide to design concepts and criteria, to create a comprehensive source book for architects and designers on interior lighting design.
