With over 7 million copies sold worldwide, WHAT TO EXPECT THE 1st YEAR is one of the world's bestselling books on infant care - and it has now been updated and revised throughout by Heidi Murkoff. This comprehensive and practical month-by-month guide clearly explains everything parents need to know - or might be worrying about - in the first year with a new baby. The book covers monthly growth and development, feeding for every age and stage, and sleep strategies that really work. It is filled with the most practical tips (how to give a bath, decode your baby's crying, what to buy for baby, and when to return to work) and the most up-to-date medical advice (the latest on vaccines, vitamins, illnesses, SIDS, safety, and more). Featuring dozens of Q&A sections, as well as a first-aid guide and charts on monthly growth and development, feeding and sleeping habits, this is the only book on infant care to address both the physical and the emotional needs of the whole family. Covering the most up-to-date knowledge, both medical and developmental, WHAT TO EXPECT THE 1st YEAR is, above all, down-to-earth and reassuring - and an invaluable aid for all parents of new babies.

The idea of The Fingerprint Sourcebook originated during a meeting in April 2002. Individuals representing the fingerprint, academic, and scientific communities met in Chicago, Illinois, for a day and a half to discuss the state of fingerprint identification with a view toward the challenges raised by Daubert issues. The meeting was a joint project between the International Association for Identification (IAI) and West Virginia University (WVU). One recommendation that came out of that meeting was a suggestion to create a sourcebook for friction ridge examiners, that is, a single source of researched information regarding the subject. This sourcebook would provide educational, training, and research information for the international scientific community.

Earth Day celebrates our beautiful planet and calls us to act on its behalf. Some people spend the day planting flowers or trees. Others organize neighborhood clean-ups, go on nature walks, or make recycled crafts. Readers will discover how a shared holiday can have multiple traditions and be celebrated in all sorts of ways.

Seven years have passed since the publication of the previous edition of this book. During that time, sensor technologies have made a remarkable leap forward. The sensitivity of the sensors became higher, the dimensions became smaller, the sensitivity became better, and the prices became lower. What have not changed are the fundamental principles of the sensor design. They are still governed by the laws of Nature. Arguably one of the greatest geniuses who ever lived, Leonardo Da Vinci, had his own peculiar way of praying. He was saying, "Oh Lord, thanks for Thou do not violate your own laws. " It is comforting indeed that the laws of Nature do not change as time goes by; it is just our appreciation of them that is being re?ned. Thus, this new edition examines the same good old laws of Nature that are employed in the designs of various sensors. This has not changed much since the previous edition. Yet, the sections that describe the practical designs are revised substantially. Recent ideas and developments have been added, and less important and nonessential designs were dropped. Probably the most dramatic recent progress in the sensor technologies relates to wide use of MEMS and MEOMS (micro-electro-mechanical systems and micro-electro-opto-mechanical systems). These are examined in this new edition with greater detail. This book is about devices commonly called sensors. The invention of a -

croprocessor has brought highly sophisticated instruments into our everyday lives.
