Conventional economic accounts, which measure Gross National Product (GNP) and related indicators of national performance, do not fully allow for the damages caused to the environment in the course of producing and consuming goods and services. Nor do they fully account for the fact that some resources are being depleted in achieving the

living standards that we enjoy today. This failure is important, because policy-makers are guided by the changes in macroeconomic indicators such as GNP. Moreover such indicators are not a good guide to the sustainability of present practices of consumption and production. This book provides practical estimates of one key area of neglect in the present national accounts - the measurement of environmental damages. The book sets out the methodology for making such estimates and then applies it to data from four countries: Germany, Italy, The Netherlands and the UK. The results show what can be achieved in the way of consistent damage estimates and what the key problems are.

Vol 6 of Advances in Environmental Accounting & Management aims to advance knowledge of the governance and management of corporate environmental impacts and the accounting for these, including issues related to measurement, valuation, and disclosure. It is particularly relevant for accounting practitioners, investors and other stakeholders of the financial and social consequences of corporate environmental impacts.

Policy failures in environment and development have been blamed on fragmented and eclectic policies and strategies. The 1992 United Nations Conference on

Environment and Development, the 'Earth Summit' in Rio de Janeiro, called therefore for an integrated approach in planning and policy making to achieve long-term sustainable growth and development. The Conference also recognized in its action plan, the Agenda 21, that integrated policies need to be supported by integrated information, notably requiring the implementation of integrated environmental and economic accounting by its member States. During the preparations for the Rio Summit, scientists and practitioners of national accounting met in a Special Conference on Environmental Accounting, organized by the International Association for Research in Income and Wealth (IARIW) in Baden, Austria. Their aim was to explore the need for and methodologies of adjusting national accounts for environmental reasons. National accountants had faced mounting criticism that conventional accounting neglected new scarcities in natural capital, as well as the social cost of environmental degradation. The result of their deliberations was a draft manual, later issued by the United Nations Statistics Division (UNSD) as a handbook of Integrated Environmental and Economic Accounting.

This title was first published in 2003. Our cherished economic indicators of income, product, consumption and capital fail in taking a long-term view of social progress. They do not account for environmental

deterioration, which impairs the quality of life of present and future generations, and hence the sustainability of development. "Greening" the conventional national (and corporate) accounts introduces environmental impacts and costs into these accounts and balances. The result is a new compass for steering the economy towards sustainability, which may change not only our main measures of economic performance but also the basic tenets of environmental and resource policies. This book presents methodological advances and case studies of environmental accounting, and discusses their use in environmental management and policies. In their introduction, the editors provide a critical perspective of historical developments and current debates.

Environmental Management Accounting (EMA) is increasingly recognised as a distinguished tool of environmental management. It helps to integrate a company's environmental and business interests, whereby enhancing corporate eco-efficiency in terms of reducing environmental costs or making one's product more competitive. This book gives a comprehensive coverage of the state of the art. It presents a number of EMA frameworks that companies can take as a basis for implementing their own specific EMA structures. Besides discussing environmental accounting issues within conventional management accounting, it gives a detailed

picture of materials flow (cost) accounting as an alternative way of looking at the ecology-economy relationships at the corporate level. A fascinating case study shows how a large company (Siemens) applies materials flow accounting and what benefits it entails.

'This is an important book. It not only serves as a valuable contribution to green accounting, it is a testament to Salah El Serafy's tireless efforts to reform the national income accounts in ways that would better reveal the sustainable product of nations and the value of development policies. No matter what differences the reader may have with some of the points made, there is no denying that the world would be a much improved place if the reforms suggested by El Serafy were implemented.' – Philip Lawn, Flinders University, Australia 'This book is a fabulous summary of Salah El Serafy's seminal contributions to "greening" national income accounts. If only we had employed the famous "El Serafy method" of investing depletion of non-renewable resources into renewable alternatives, the world would be in a much stronger and more sustainable place today. Hopefully it is not too late to take up this and El Serafy's many other recommendations for improving national income accounting.' – Robert Costanza, Portland State University, US Though scientists and environmentalists have long

expressed concern over the rapid deterioration of the global environment, economists have largely failed to recognize the issue's relevance to their field. Salah El Serafy argues for an increased focus on the economic aspects of environmental degradation, calling for a fundamental shift in how economists measure and discuss national income. Through a combination of new material reflecting recent developments in the field and previously published essays that provide a history of green accounting, the author emphasizes the importance of considering natural resources as part of a nation's economic capital. Setting forth what has become known as the 'El Serafy Method', this fascinating and complex volume presents both the justification and the methodology for giving the environment a place in the global economic conversation. Students, professors, researchers and policymakers in the field of environmental and ecological economics will no doubt find much to appreciate in this thoughtful and comprehensive analysis of the intersection between economics and the environment.
