On the reclaimed land, the soil liquefaction occurred at the peak acceleration of 200–250 gal and the period elongated about twice, which means the stiffness decreased to 1/4 of the original.

(3) Repeated property c w of the ground motions was studied using the 32 sets of records observed in the 2011 Great East Japan Earthquake. The repeated property is similar to those of past interplate earthquakes.

~~Effect of earthquake ground motions on soil liquefaction ...~~

The next day, the Superstition Hills (M6.6) earthquake produced surficial evidence of liquefaction in the area of the strong motion instruments. Recorded pore pressure measurements, however, were considered by some to be inconsistent with the recorded ground motion measurements leading to published discussions that described significant technical disagreements in the geotechnical earthquake engineering literature.

~~CASE STUDY OF THE GROUND MOTION ANALYSES AND SEABED SOIL ...~~

An assessment of the liquefaction potential at soil sites based on peak ground motion parameters observed at the surface during earthquakes is proposed. By performing parametric studies using one-dimensional seismic response analyses, an expression for the maximum earthquake-induced shear stress incorporating both peak ground acceleration (PGA) and peak ground velocity (PGV) was formulated.

Soil Liquefaction During Earthquakes

Soil liquefaction, also called earthquake liquefaction, ground failure or loss of strength that causes otherwise solid soil to behave temporarily as a viscous liquid.

The phenomenon occurs in water-saturated unconsolidated soils affected by seismic S waves (secondary waves), which cause ground vibrations during earthquakes. Although earthquake shock is the best known cause of liquefaction, certain construction practices, including blasting and soil compaction and vibroflotation (which uses a ...

cyclic shear stresses (CSR) due to the ground motion. The latter is, of course, a function of the design earthquake parameters, while the former depends on the soil shear strength and can be computed using results from SPT data. In fact, one of the most common parameter for estimating soil resistance to liquefaction is the number of blows N .

horizontal ground motions within the soil column (i.e. acceleration, stress, strain time histories) are often computed using dynamic soil response models such as SHAKE (Schnabel et al 1972), ProShake 2004, DESRA (Lee and Finn 1978) and SUMDES (Li et al 2000). The input, or bedrock, ground motions required for these numerical models are

~~RECOMMENDED GUIDELINES FOR LIQUEFACTION EVALUATIONS~~

Soil liquefaction is the phenomenon in which the stiffness and the strength of the soil are lost under the action of earthquake force or due to rapid loading conditions. Soil liquefaction occurs in a fully saturated

soil. To read more, please click [here](#).

How to Evaluate Liquefaction Potential of Soils in the Field?

Soil liquefaction occurs when a saturated or partially saturated soil substantially loses strength and stiffness in response to an applied stress such as shaking during an earthquake or other sudden change in stress condition, in which material that is ordinarily a solid behaves like a liquid. In soil mechanics, the term "liquefied" was first used by Allen Hazen in reference to the 1918 failure of the Calaveras Dam in California. He described the mechanism of flow liquefaction of the embankment

Ground improvement methods have been used for over 70 years to densify loose sands prone to liquefaction. Although these methods reduce liquefaction triggering potential and settlement in densifiable soil, such as loose clean sand, their impacts on soils that are difficult to densify, such as silty soils, are not well understood.
