The Book of Human Insects is a Japanese seinen manga series written and illustrated by Osamu Tezuka. It is about Toshiko Tomura, the "Woman of Talent", who is able to leech the abilities out of people, constantly reinventing herself. The manga was originally serialized in Akita Shoten's manga magazine Play Comic from May 9, 1970 to February 13, 1971. It has been published in Japan multiple times by many publishers, in either an omnibus edition or two volumes. Vertical published an omnibus editio

The Book of Human Insects. Featuring a noir cast of jaded journalists, anarchist hit men, right-wing shadow brokers, cutthroat executives, and spent artists, The Book of Human Insects traces the career of an ingenue who is every bit those men's match but is far from a feminist role model. In step with a heroine who is equally self-seeking, the usually "humanist" author here achieves with a Wellesian smirk a portrait of a world without heroes.

Toshiko Tomura is a genius; the darling of the intelligentsia. A modern-day Michelangelo, this twenty year-old is already an established international stage actress, an up-and-coming architect, and the next recipient of the prestigious Akutagawa Prize as Japan's best new writer. Her actions make headlines in the papers, and inspire radio and television programming. And like many great talents, her troubled past is what motivates her to greatness. She has the amazing ability to emulate the talents of others.

Toshiko is also the mastermind behind a series of murders. The ultimate mimic, she has plagiarized,

Tomura Toshiko gains false fame as a designer, novelist and actress, by stealing the ideas & creations of others and passing them off as her own.

This pioneering book looks at the importance of insects to culture. While in the developed West a good deal of time and money may be spent trying to exterminate insects, in other cultures human-insect relations can be far more subtle and multi-faceted. Like animals, insects may be revered or reviled - and in some tribal communities insects may be the only source of food available. How people respond to, make use of, and relate to insects speaks volumes about their culture. In an effort to get to the bottom of our vexed relationship with the insect world, Brian Morris spent years in Malawi, a country where insects proliferate and people contend. In Malawi as in many tropical regions, insects have a profound

impact on agriculture, the household, disease and medicine, and hence on oral literature, music, art, folklore, recreation and religion. Much of the complexity of human-insect relations rests on paradox: insects may represent the source of contagion, but they are also integral to many folk remedies for a wide range of illnesses. They may be at the root of catastrophic crop failure, but they can also be a form of sustenance. Weaving science with personal observations, Morris demonstrates a profound and intimate knowledge of virtually every aspect of human-insect relations. Not only is this book extraordinarily useful in terms of the more practical side of entomology, it also provides a wealth of information on the role of insects in cultural production. Malawian proverbs alone provide many such delightful examples - 'Bemberezi adziwa nyumba yake' ('The carpenter bee knows his own home'). This final volume in Morris' trilogy on Malawi's animal and insect worlds is certain to become a classic study of uncharted territory - the insect world that surrounds us and how we relate to it. Praise for *The Power of Animals*: Although based upon examination of a single culture, Morris incorporates ecological and anthropological concepts that expand this study of

Insects are seldom mentioned in discussions surrounding human history, yet they have dramatically impacted today's societies. This book places them front and center, offering a multidisciplinary view of their significance. Diseases vectored by insects have killed more people than all weapons of war. Fleas are common pests, but some can transmit illnesses such as the bubonic plague. In fact, three pandemics can be traced back to them. Epidemics of typhus have been caused by lice. Conversely, humans have also benefitted from insects for millennia. Silk comes from silkworms and honey comes from bees. Despite the undeniably powerful effects of insects on humans, their stories are typically left out of our history books. In *The Silken Thread*, entomologists Robert N. Wiedenmann and J. Ray Fisher link the history of insects to the history of empires, cultural exchanges, and warfare. The book narrows its focus to just five insects: a moth, a flea, a louse, a mosquito, and a bee. The authors explore the impact of these insects throughout time and the common threads connecting them. Using biology to complement history, they showcase these small creatures in a whole new light. On every page, the authors thoughtfully analyze the links between history and entomology. The book begins with silkworms, which have been farmed for centuries. It then moves to fleas and their involvement in the spread of the plague before introducing the role lice played in the Black Death, wars, and immigration. The following section concerns yellow fever mosquitos, emphasizing the effects of yellow fever in the Americas and the connection to sugar and slavery. After discussing the importance of western honey bees, the authors tie these five insects together in an exciting closing chapter.

Contributors explore common elements in the evolutionary histories of both human and insect agriculture

resulting from convergent evolution. During the past 12,000 years, agriculture originated in humans as many as twenty-three times, and during the past 65 million years, agriculture also originated in nonhuman animals at least twenty times and in insects at least fifteen times. It is much more likely that these independent origins represent similar solutions to the challenge of growing food than that they are due purely to chance. This volume seeks to identify common elements in the evolutionary histories of both human and insect agriculture that are the results of convergent evolution. The goal is to create a new, synthetic field that characterizes, quantifies, and empirically documents the evolutionary and ecological mechanisms that drive both human and nonhuman agriculture. The contributors report on the results of quantitative analyses comparing human and nonhuman agriculture; discuss evolutionary conflicts of interest between and among farmers and cultivars and how they interfere with efficiencies of agricultural symbiosis; describe in detail agriculture in termites, ambrosia beetles, and ants; and consider patterns of evolutionary convergence in different aspects of agriculture, comparing fungal parasites of ant agriculture with fungal parasites of human agriculture, analyzing the effects of agriculture on human anatomy, and tracing the similarities and differences between the evolution of agriculture in humans and in a single, relatively well-studied insect group, fungus-farming ants.

The human reaction to insects is neither purely biological nor simply cultural. And no one reacts to insects with indifference. Insects frighten, disgust and fascinate us. Jeff Lockwood explores this phenomenon through evolutionary science, human history, and contemporary psychology, as well as a debilitating bout with entomophobia in his work as an entomologist. Exploring the nature of anxiety and phobia, Lockwood explores the lively debate about how much of our fear of insects can be attributed to ancestral predisposition for our own survival and how much is learned through individual experiences. Drawing on vivid case studies, Lockwood explains how insects have come to infest our minds in sometimes devastating ways and supersede even the most rational understanding of the benefits these creatures provide. No one can claim to be ambivalent in the face of wasps, cockroaches or maggots but our collective entomophobia is wreaking havoc on the natural world as we soak our food, homes and gardens in powerful insecticides. Lockwood dissects our common reactions, distinguishing between disgust and fear, and invites readers to consider their own emotional and physiological reactions to insects in a new framework that he's derived from cutting-edge biological, psychological, and social science.
