Supersaturated Solution - Definition, Examples ...

A supersaturated solution is a solution with more dissolved solute than the solvent would normally dissolve in its current conditions.

Supersaturation is achieved by dissolving a solute in one set of conditions, then transferring it to other conditions without triggering any release of the solute.

Supersaturated solutions are extremely unstable, but often require a triggering event to begin returning to a stable state via the solute coming out of solution.

Under pressure a gas can be dissolved in a liquid; when the pressure is released, the gas becomes

supersaturated and gas bubbles can form. The gas should be well soluble in the liquid, usually water, to obtain a sufficient volume of bubbles.

Carbon dioxide and laughing gas ( $N_2O$ ) are suitable. Pressures up to about 8 bar are applied.

Supersaturation - an overview | ScienceDirect Topics

The recrystallization of the excess dissolved solute in a supersaturated solution can be initiated by the addition of a tiny crystal of solute, called a seed crystal. The seed crystal provides a nucleation site on which the excess dissolved crystals can begin to grow. Recrystallization from

Supersaturated Solutions Increased temperature usually increases the solubility of solids in liquids. To understand why, we need to return to the Second Law of Thermodynamics. Increased temperature means a greater average velocity for the particles.

And of course, a supersaturated solution describes a solution that contains an amount of solute GREATER than the amount of solute that would be in equilibrium with undissolved solute. You must simply know these definitions.....being able to trot them out verbatim will save you a lot of angst in an exam.

What is a supersaturated solution? -  
Answers

A supersaturated solution is a solution that contains less than the maximum amount of solution per given amount of solvent at a particular temperature. When more solutions is added to a supersaturated solution the solution will crystallize rapidly to form crystals and hence remains supersaturated only.

A supersaturated solution, on the other hand, is when the excess of solute is dissolved in the solvent as a result of changes in temperature, pressure or other conditions. At room temperature, a saturated solution keeps the maximum possible amount of solute, and the rest becomes excess.

Supersaturation occurs with a  
chemical solution when the  
concentration of a solute exceeds the

## Supersaturation - Wikipedia

A supersaturated solution contains more solute at a given temperature than is needed to form a saturated solution. Increased temperature usually increases the solubility of solids in liquids. For example, the solubility of glucose at 25 ° C is 91 g/100 mL of water. The solubility at 50 ° C is 244 g/100 mL of water.

What also happens is that some of the dissolved ions collide back again with the crystal and remain there.

Recrystallization is the process of dissolved solute returning to the solid state. At some point the rate at which the solid salt is dissolving becomes equal to the rate at which the dissolved solute is recrystallizing.

## Supersaturated Solution

Once  $e_s \leq e$ , then  $s > 0$  and the air parcel is supersaturated. This supersaturated situation is not stable; the water vapor in excess of  $e_s$  forms liquid. As the uplift continues, more water vapor is converted into liquid water and the vapor pressure remains close to  $e_s$ . All convective clouds, that is clouds with vertical extent, form this way.

Supersaturated Solution: Definition & Example - Video ...

A supersaturated solution is a solution that contains more solute than what the solvent can dissolve. In case you haven't taught what a solute/solvent is, a solute is the substance that is dissolved IN the solution, such as salts (but not limited to salts). The most common example is the supersaturated Sodium Acetate.
